

EduVision – Dashboard User Guide

How to navigate, filter, and interpret the dashboard

1. Purpose

This guide explains how to use the EduVision Power BI dashboard to explore higher-education performance. The dashboard is organized into four analytical areas: University Overview, Research Analytics, Student Analytics, and Country Comparison.

2. University Overview

- Use university, country, year, and other available filters to narrow the analysis.
- Review ranking and overall performance KPIs first.
- Use visual comparisons to identify stronger and weaker university performance.
- Use detailed university-level information to investigate individual institutions.

3. Research Analytics

- Review research output and research productivity indicators.
- Compare academic reputation and citation-related performance.
- Use filters to compare universities, countries, or other available dimensions.
- Treat citation and publication measures as complementary indicators rather than a single measure of research quality.

4. Student Analytics

- Review total students and international student indicators.
- Compare undergraduate and postgraduate populations where available.
- Use faculty and faculty-to-student indicators to understand institutional scale and staffing.
- Review gender-related percentages as descriptive indicators within the available dataset.

5. Country Comparison

- Select countries to compare higher-education performance.
- Review country average rank, best university rank, and number of ranked universities.
- Compare average overall score, academic reputation, citation performance, and international student ratio.
- Remember that country averages can be influenced by the number and composition of universities represented.

6. Navigation and Filters

- Use dashboard navigation controls to move between analytical pages.
- Clear filters when starting a new comparison.
- Check the selected year before interpreting ranking or performance values.
- When a visual appears to change unexpectedly, inspect active filters and slicer selections first.

7. Dashboard QA Checklist

- All dashboard pages open correctly.
- Navigation between pages works.
- Slicer/filter selections affect the intended visuals.
- KPI cards agree with the underlying dataset.
- Rankings sort in the intended direction.
- No unexpected blank categories or duplicate labels appear in key visuals.
- The final PBIX opens successfully and contains the intended report pages.
